INSTALLATION & SERVICING INSTRUCTIONS

Windsor

RADIANT CONVECTOR GAS FIRE

This appliance should be installed by a qualified gas installer

Parkinson Cowan Appliances

IMPORTANT—INSTALLATION AND SAFE

This appliance must be installed in accordance ... Gas Safety Regulations and the Building Regulations or ... Scotland), respectively.

The fire is suitable for fixing to any conventional ... or properly constructed pre-cast flues having a minimum cross sectional ... cm^2 (20 $in.^2$) and being at least one storey high.

It is emphasised that pre-cast flues must be built in such a way that mortar fangs between blocks are not extruded into the flueway and that, if raking blocks are used, they must be used according to the manufacturer's instructions. Mortar must not be allowed to drop down and accumulate on the raked portions.

CHECK CHIMNEY

Before fitting the fire the flue should be inspected to ensure :—

1. That the chimney is not in any way obstructed. If necessary have the chimney swept particularly if solid fuel has been previously burnt.
2. That any dampers are removed or fixed in the open position.
3. That any underdraught openings to the fireplace are sealed.
4. That there is a flue pull up the chimney when tested with a lighted match.
5. That the room has a reasonable supply of fresh air.

1 NOTES ON FITTING

The Windsor fire is **not** suitable for wall-mounting. It must be fitted on a non-combustible hearth or hearth-slab of material at least 13 mm (½ in.) thick extending forward from the sides of the fireplace opening by a minimum of 305 mm (12 in.) and extending beyond the width of the fireplace opening by a minimum of 153 mm (6 in.) at each side.

Carpeting must not be laid on the hearth or extended under the fire.

The fire may be fitted to a combustible cladded-wall, e.g. wood panelling, provided that the combustible material is removed from the rear of the fire such that the closure plate overlap the cladded wall by a maximum of 13 mm (½ in.).

It is essential that any cladded-wall fireplace opening is inspected to ensure :—

(i) That the cladding fits snugly to the finished wall-face ; or any cavities are sealed off, to obviate excessive air leakage into the chimney which would render the flue ineffective.

(ii) That the flue spigot projects adequately into the flueway. (Flue spigot extension pieces should be used for this purpose where necessary.)

(iii) That the closure plate is positively sealed to the finished wall-face.

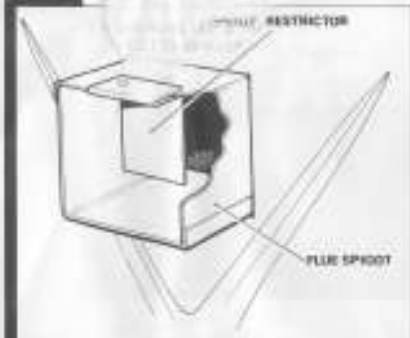
2 FITTING THE CLOSURE PLATE

A closure plate is supplied with the appliance. Where the appliance is fitted to a precast flue then a cooler plate (not supplied) must be screwed onto the closure plate in the position shown in Fig. 1. The cooler plate can be made from 0·9 mm (20 gauge) aluminium. The relief air opening must be increased to 114 mm (4·5 in.) x 38 mm (1·5 in.) As shown in Fig. 1.

Fit the closure plate over the fireplace opening and ensure that it is centrally positioned. Thoroughly seal the closure plate edges in position with an approved adhesive tape. The cut-out in the bottom of the closure plate is the relief air opening and must be unobstructed to provide good ventilation in the room.

Test that an up-draught is available at the spigot hole by applying smoke, or a lighted taper, or a lighted match. If down-draught or lack of draught is found the appliance **must not** be fitted until a reliable flue updraught has been established by modifying or unblocking the flue way.

3 PARING THE FIRE



Unpack the fire according to the instructions on the carton top flap.

If the flue is more than 4·25 m (14 ft.) in height, the spigot restrictor must be clipped onto the top edge of the flue spigot so that it partly obstructs the outlet hole (Fig. 2).

Do not fit the spigot restrictor if :

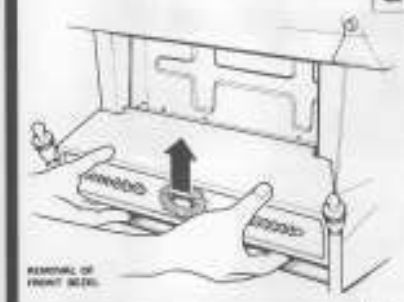
(a) The flue is less than 4·25 m (14 ft.).

(b) The flue is a 'precast' type.

(c) The flue pull is suspected to be poor.

4 FIT THE FIRE AND CONNECT TO GAS

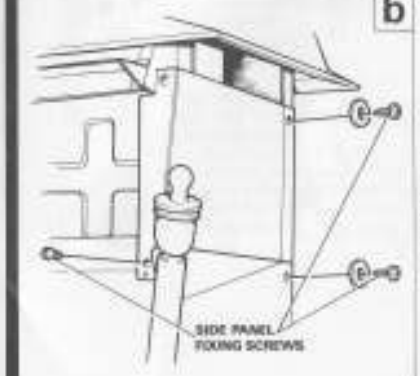
a



Remove the bottom bezel by sliding it upwards and free of its locations behind the decorative legs as shown.

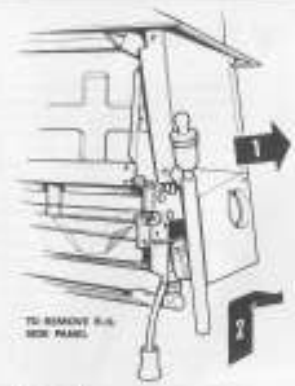
Take care not to scratch the legs when removing and replacing the front bezel.

b



Remove the right hand side panel by taking out the pozidriv screw at the bottom of the right hand side reflector cheek and the two pozidriv screws at the top and bottom back corners of the side panel, as shown in diagram.

c

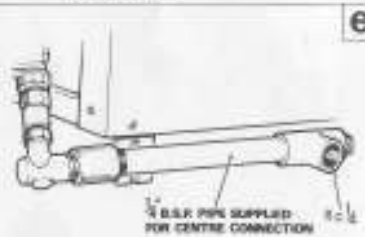


Firstly pull out the top and back of the right hand side panel and then lift to remove, see diagram.

d

The gas supply terminates in a ½" B.S.P. union elbow and socket. Release the union nut to secure the elbow to the pipework from the right or left hand side.

e



For left hand or centre connection, from the rear of the fire, an extra length of pipe is supplied.

This pipe has a ¼" B.S.P. tee-piece with plug at one end, and therefore allows the gas inlet pipe to be fitted in the normal fashion. For left hand or right hand connection fit the pipework up to and including the union elbow. Then check the joints for soundness before fitting the fire.

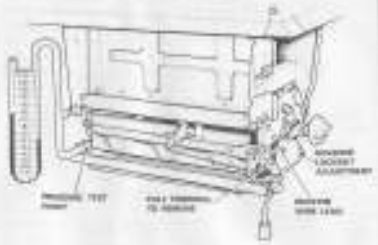
f

Place the fire up against the closure plate. Make sure that the flue spigot projects through the cut out provided for it in the closure plate.

Level the fire by sliding up the decorative leg skirt and adjusting the support foot.

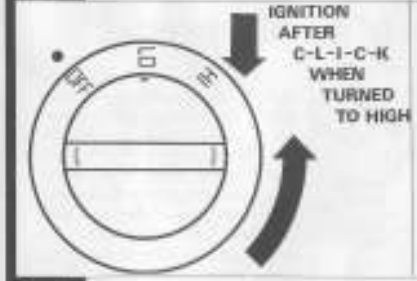
Then tighten the union nut into the elbow.

5 CHECK THE BURNER PRESSURE AND TEST FOR GAS SOUNDNESS



The correct burner pressure is shown on the chart at the end of these instructions. Remove the screw from the pressure test point, see diagram. Connect a pressure gauge to the test point. Support the rigid metal wire terminal with one hand and carefully remove the ignition wire lead. Turn on the fire to 'HI' slacken the governor locknut and adjust the governor to give the correct pressure. Tighten up the locknut, check the pressure setting then turn the fire to OFF. Re-connect the ignition wire lead, remove the gauge and replace the pressure test screw. Test all gas joints before and at the tap, for soundness with the tap turned off. Use a soap solution.

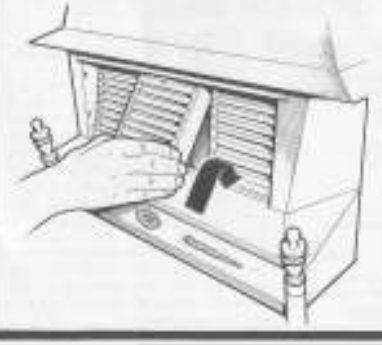
6 CHECK IGNITION AND CROSS LIGHTING



A piezo-electric spark is used for ignition on this fire. The mechanism is operated by turning the control knob to the 'HI' position where there will be a C-L-I-C-K and the gas will ignite.

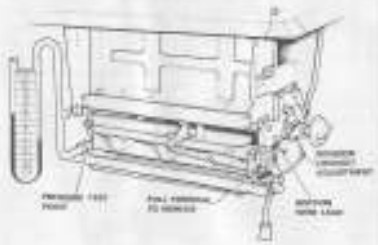
Check that the burner cross-lights after ignition and also that on turning to the 'LO' position only the centre burner is alight.

7 FIT THE RADIANTS



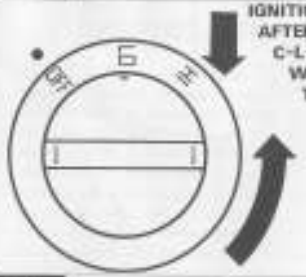
Place the radiants in the fire by inserting their tops beneath the inside canopy, and raising them clear of the radiant support. Then gently lower each radiant into position. Ensure that the radiants are pushed back against the Heat Exchanger Panel.

5 CHECK THE BURNER PRESSURE AND TEST FOR GAS SOUNDNESS



The correct burner pressure is shown on the chart at the end of these instructions. Remove the screw from the pressure test point, see diagram. Connect a pressure gauge to the test point. Support the rigid metal wire terminal with one hand and carefully remove the ignition wire lead. Turn on the fire to "HI" slacken the governor lock-nut and adjust the governor to give the correct pressure. Tighten up the locknut, check the pressure setting then turn the fire to OFF. Re-connect the ignition wire lead, remove the gauge and replace the pressure test screw. Test all gas joints before and at the tap, for soundness with the tap turned off. Use a soap solution.

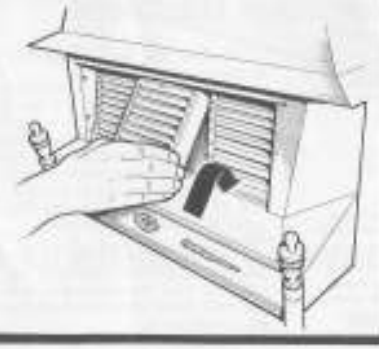
6 CHECK IGNITION AND CROSS LIGHTING



A piezo-electric spark is used for ignition on this fire. The mechanism is operated by turning the control knob to the 'HI' position where there will be a C-L-I-C-K and the gas will ignite.

Check that the burner cross-lights after ignition and also that on turning to the 'LO' position only the centre burner is alight.

7 FIT THE RADIANTS



Place the radiants in the fire by inserting their tops beneath the inside canopy, and raising them clear of the radiant support. Then gently lower each radiant into position. Ensure that the radiants are pushed back against the Heat Exchanger Panel.

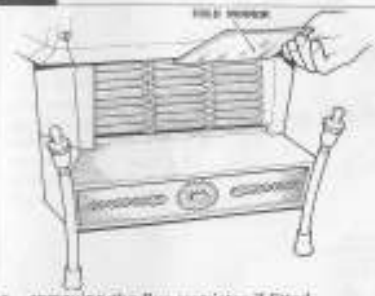
8 COMPLETE THE FITTING

Replace the right hand side panel and Bottom Bezel by reversing the action in Section 4.

Fit the Dress Guard by pushing the top of the dress guard underneath the canopy; then locate one of the fixing tags in the chrome reflector cheek, and spring home the other tag in the opposite cheek.

Ensure that the user understands the User's Instructions and in particular can turn the fire on and off correctly.

9 TEST FOR SPILLAGE



Close all doors and windows in the room.

Light the fire and leave full on for ten minutes.

Check that the products of combustion are not spilling into the room by holding a cold mirror above the front edge of the canopy. The mirror should not cloud over if the combustion products are being cleared. If clouding does occur then the flue is too restricted. This can be rectified by either:–

a. removing the flue restrictor if fitted
OR
b. removing any other blockage in the chimney.

Re-check the fire for spillage.
If spillage persists, disconnect the fire and report to your supervisor.

INJECTOR SIZES AND PRESSURES CONVERSION SET

	GAS GROUP	3	4	5	Nat. Gas
	INJECTOR SIZE (REF. MARK)	C	C	C	2
INCHES W.G.	MIN. SUPPLY PRESSURE	3	3	3	8
	COLD SETTING PRESSURE	1·45	1·75	2·1	7
MILLI-BARS	MIN. SUPPLY PRESSURE	7·47	7·47	7·47	19·7
	COLD SETTING PRESSURE	3·61	4·35	5·21	17·4

Injector sizes and pressures to give the correct heat input of 5·27 kW (18,000 Btu/Hr.) are given in the table above. The figures relate to the appliance turned full on. (The cones of the flames must be well defined).

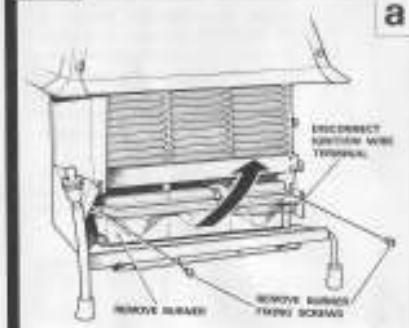
BIRMINGHAM · B33 9AD Drg. No. 41709/4

ICING NOTES

A REMOVAL OF BURNERS

a



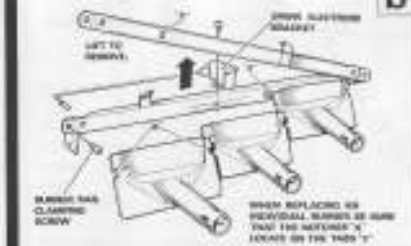
Remove the dress guard by springing out the location tag on one reflector cheek and then pull the guard free of the canopy and the other cheek. (See Section B).

Remove the Bottom Bezel and right hand side panel as in the Fitter's Instructions. (Section 4).

Support the rigid ignition wire terminal with one hand and carefully remove the flexible ignition wire lead. See Installation Instructions (Section 5).

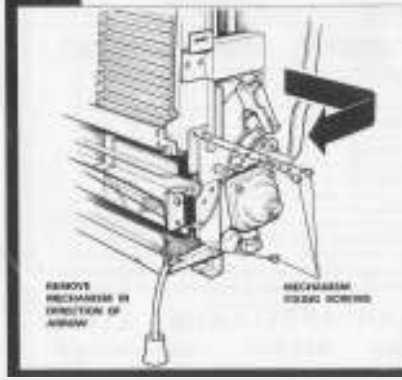
Take out the two burner fixing screws and remove the burner assembly by pulling in the direction indicated.

b



Exchange the individual burners if necessary by first removing the spark electrode centre bracket, and then loosening the pozidriv screw in the back of the burner support. Take care to re-align the electrode locating wire as shown in Section E.

B REMOVAL OF MECHANISM



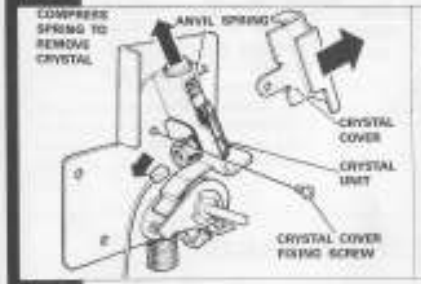
Turn off the gas supply to the fire. Remove the dress guard, the bottom bezel, and the right hand side panel as in Section A. Disconnect the inlet pipe at the union elbow. Remove the three pozidriv screws which hold the mechanism and burners to the body of the fire; then pull the mechanism forwards and towards the right hand side of the fire so that the pipework will not be caught on the case. When reassembling ensure that the tab on the left hand burner bracket locates in the slot provided. Test all joints for gas soundness.

C DISMANTLING OF DU[illegible] TAP

Test all joints for gas soundness.

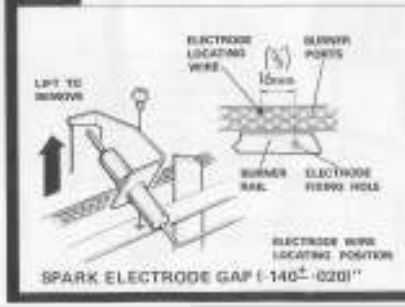
Turn off the gas supply to the fire. Check that the tap is turned to the OFF position then remove the dress guard, bottom bezel and right hand side panel as in Section A. Disconnect the ignition wire lead from the rigid metal wire terminal. Remove tap knob. (See fitters instructions Section 5). Take out the two slotted head screws which hold the tap mounting bracket onto the side of the R.H. burner bracket and then remove the two cheese head screws which hold the spindle assembly onto the tap body. Now pull out the spindle assembly complete with mounting plate and cock spring and remove the tap plug carefully. The tap can now be cleaned and re-greased if necessary using "Molycote 1102" grease or equivalent. Re-assemble the tap as shown in diagram. Ensure that the tap plug is replaced with the slotted hole on the left hand side and check that the roll pin on the spindle is pointing downwards so that the spindle stop catch will line up with the plug.

D EXCHANGE OF IGNITION CRYSTAL



After taking off the Dress Guard, Bottom Bezel and right hand side panel as before, remove the pozidriv screw which holds the metal cover over the black piezo crystal unit. Take off this cover and disconnect the ignition wire lead from the unit. Compress the metal anvil spring next to the crystal unit and remove the crystal unit. Reverse the procedure to fit the new crystal unit. Ensure that the domed end of the crystal unit is downwards.

E EXCHANGE OF SPARK ELECTRODE

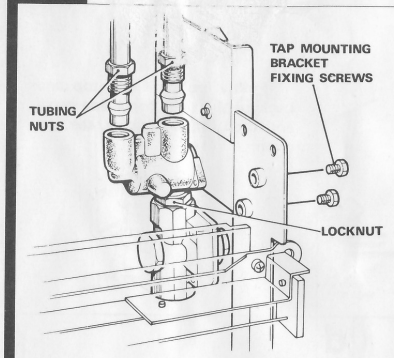


Remove the burner assembly as described in Section A.

Remove the pozidriv self-tapping screw which holds the spark electrode bracket to the burner support channel. Carefully slide this unit free of the burner, at the same time releasing the electrode wire from the insulator at the R.H. end of the Burner Unit. See Diagram and Fitter's Instructions (Section 5).

Reverse this procedure to replace the spark electrode bracket, ensuring that the locating wire is carefully fitted down the back row of burner ports.

CHANGE OF TAP UNIT



Remove the gas mechanism and burners as in Section B. Remove the two slotted head screws which hold the tap assembly mounting bracket onto the side of the R.H. Burner Bracket (see section C) and disconnect the ignition wire lead from the spark electrode metal wire terminal. Carefully unscrew the two hexagonal tubing nuts (ensure that the olives are in position). Loosen the locknut between the governor and the tap and unscrew the governor. The complete tap unit is now replaced by reversing the procedure. The distance between the centre line of the governor and the tap spindle should be approx. 56mm (2.2"). Before replacing the front and R.H. side panels, test all joints for gas soundness.
